Abstract

This experiment explores the AI-assisted features and built-in analytics of Zoho Creator. The Membership Enrollment Form builder was examined for Zia and its field groups, the Zia option for building forms with AI was opened and the platform's access requirement was recorded, and the built-in analytics of the application, namely the charts and Board of the Gym Membership Dashboard, were reviewed with live membership data.

1. Aim

To explore the AI-assisted features and built-in analytics provided by Zia in Zoho Creator.

2. Concepts

Zia. Zoho's AI assistant. In Creator it supports building apps and forms with AI, and AI-assisted fields and search. Using it requires a paid plan and an LLM of the user's choice configured in the Zia settings, and the Zia features relevant to the account must be enabled.

Form builder field groups. The left panel of the Form Builder groups fields into Basic, Advanced (for example Decision box, Rich Text, Url, Image, Percent, Currency) and Special Fields (Section, Add Notes, Users, Integration, AR).

Built-in analytics. Charts, Boards and reports built from the form data without writing code. The Gym Membership Dashboard from Experiment 5 summarises members by plan, membership type and workout interest.

Use case. Zia could help the trainers by analysing the free-text Health Notes members enter on enrollment, while the dashboard already gives the manager a quick view of plan demand and the mix of new, renewal and corporate members.

3. Procedure

1. Open the Membership Enrollment Form in the Design tab and review the field palette on the left: the Advanced Fields and Special Fields groups.
2. Select a field (Member Name) and review Field Properties on the right: field name, link name (Member_Name), the Mandatory validation and the display fields.
3. Click the Zia option on the form canvas to open Building apps and forms with Zia, and note the access conditions it shows.
4. Open the live Gym Membership Dashboard and review the Board, the pie chart (members by membership type) and the column chart (members by workout interest) as the built-in analytics.
5. Hover over a chart segment to read the value, for example the number of members of the New type.

4. Implementation Screenshots (GYM MEMBERSHIP application)

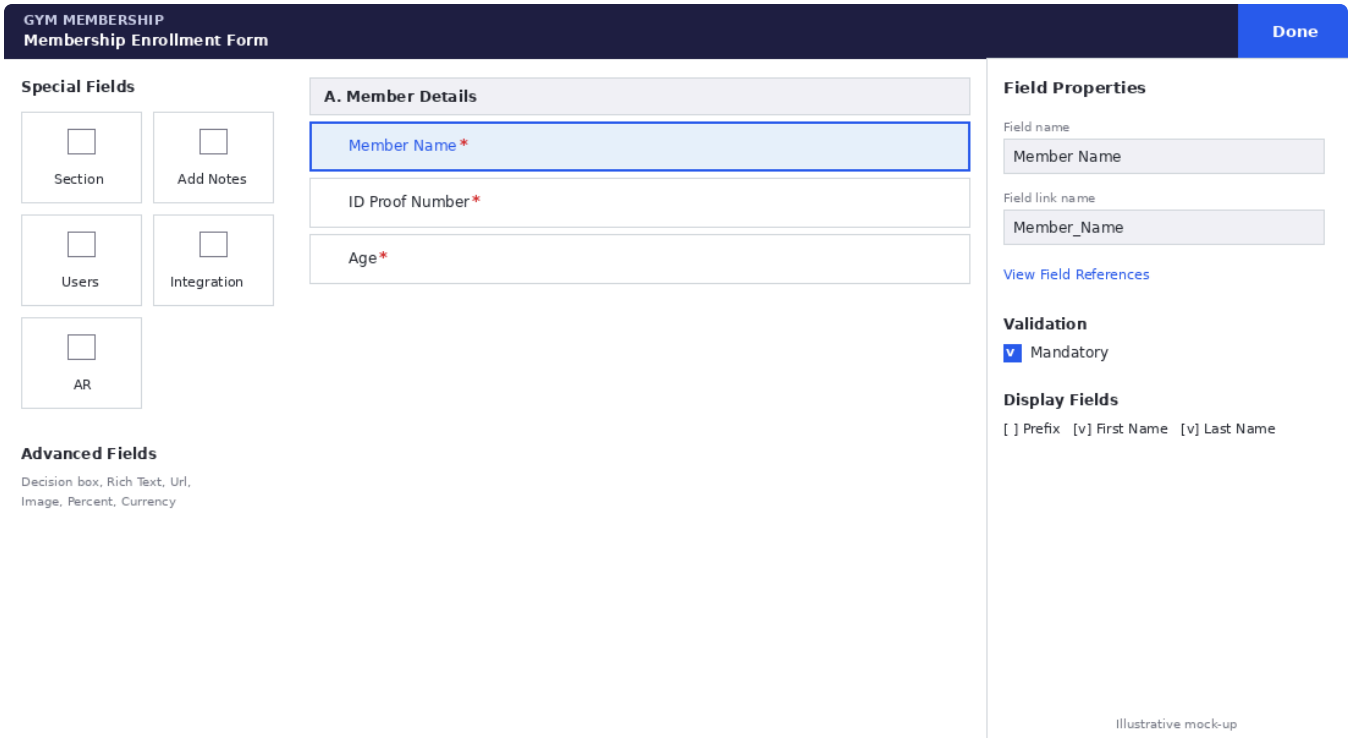

Figure 1: Form Builder palette (Special Fields group) and Field Properties of Member Name, with the field link name

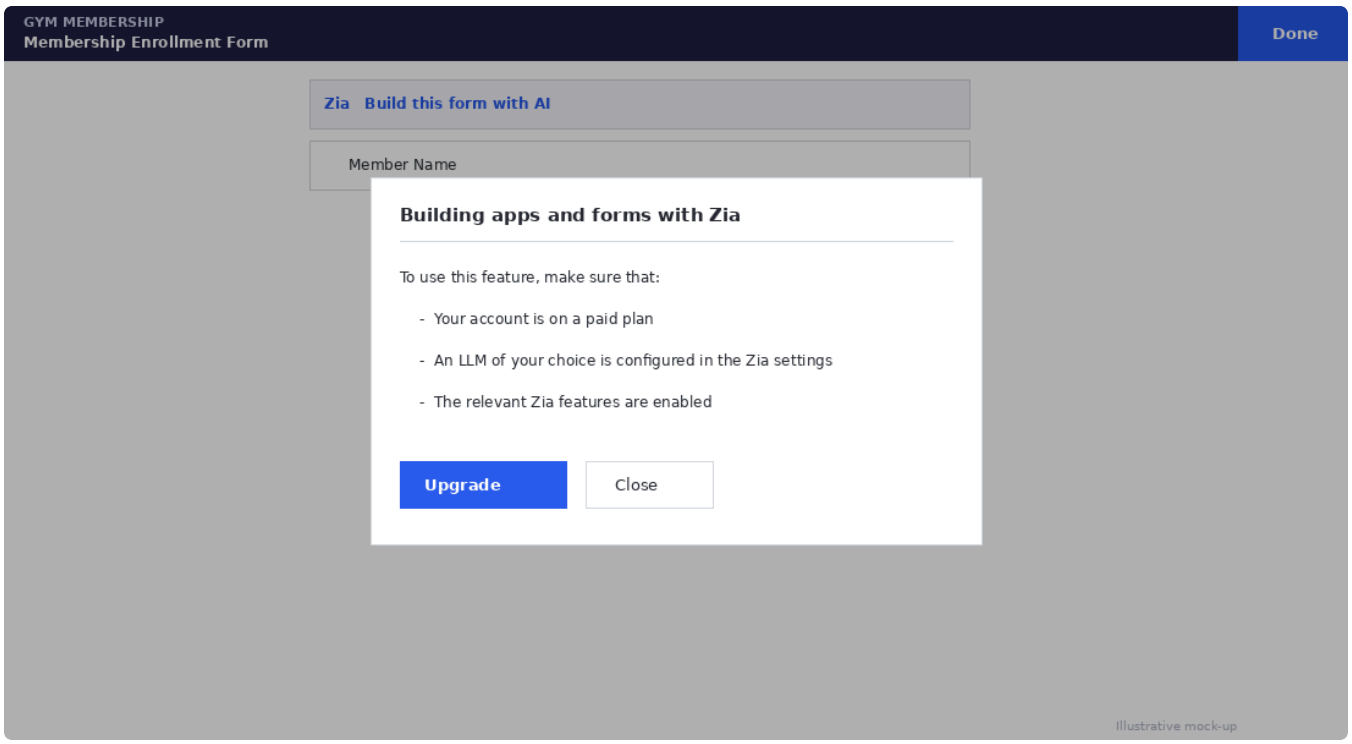

Figure 2: Zia option in the Form Builder: conditions to access the feature

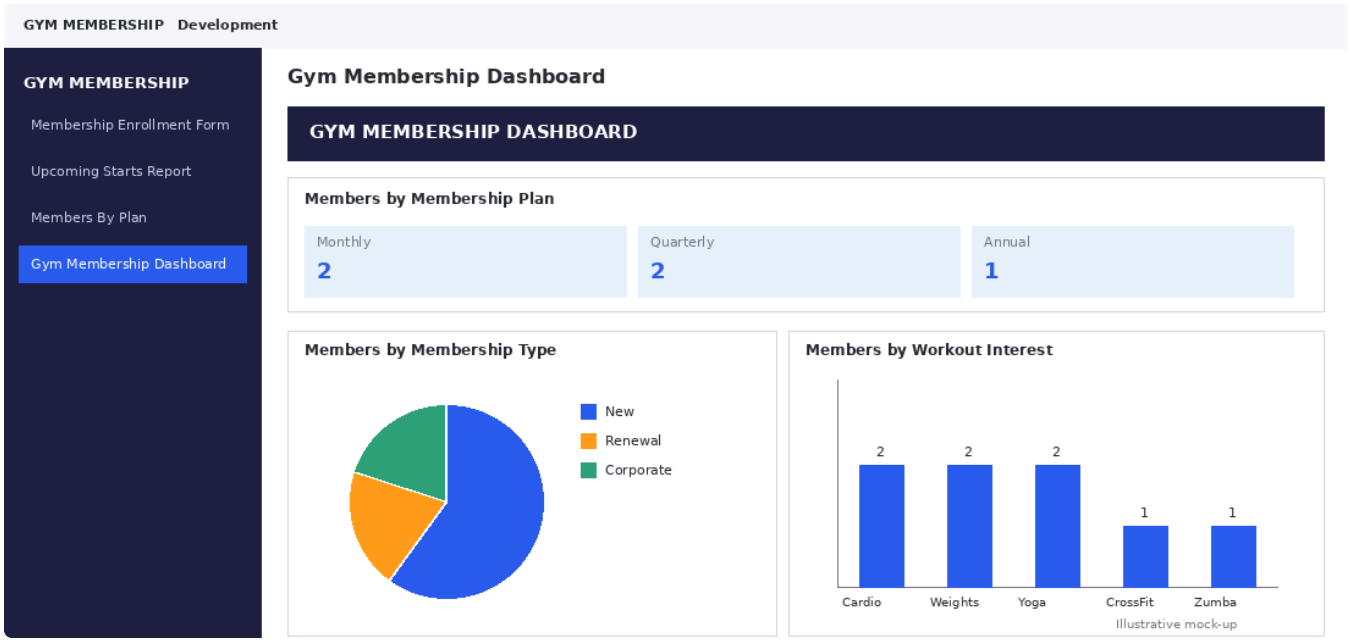

Figure 3: Built-in analytics: live Gym Membership Dashboard with the Board and charts (built in Experiment 5)

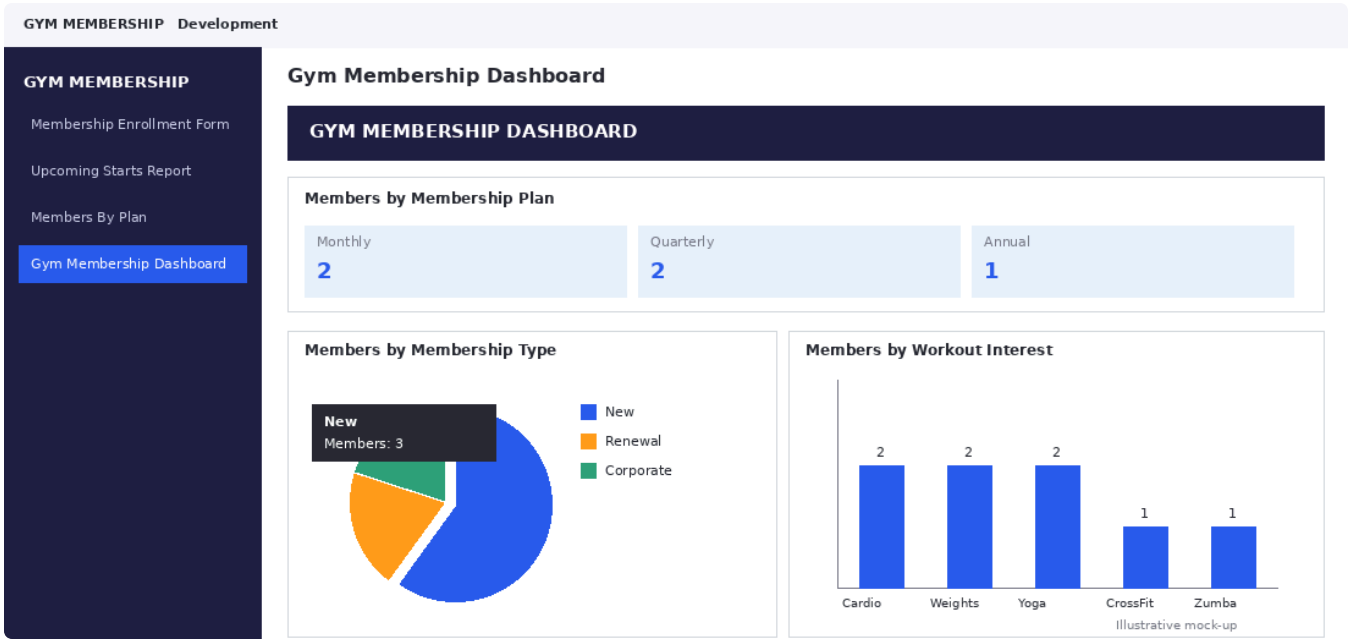

Figure 4: Chart tooltip showing the number of members of the New type (built in Experiment 5)

5. Expected Output

If the account is on a free or expired trial plan, the Zia form-building option is not available: Zoho Creator asks the user to upgrade to a paid plan, configure an LLM in the Zia settings and enable the relevant Zia features. The built-in analytics work with the existing data, and the dashboard shows 2 Monthly, 2 Quarterly and 1 Annual member, members by membership type (3 New, 1 Renewal, 1 Corporate) and members by workout interest.

6. Result

The procedure above was prepared for the GYM MEMBERSHIP application. The observed results are recorded through the screenshots in the figures above. Where a feature is restricted by the account plan, the message shown by Zoho Creator is included as the screenshot and treated as the observed result.

7. Learning Outcome

Learnt what Zia offers in Zoho Creator and what it needs (a paid plan, a configured LLM and enabled Zia features), how the form builder groups its fields, and how the built-in charts and Board provide analytics on form data without code.
